THE CLAIMS

- 1. (Currently Amended) Apparatus for preventing fluid transfer through an opening connecting an oviduct to a uterine cavity, the apparatus comprising:
 - a body having a base with a periphery;
 - a seal carried by the body for overlying and engaging uterine tissue leading to the opening and receiving fibroblast in-growth to create a hermetic seal between the oviduct and the uterine cavity; and
 - a peripheral anchor portion extending from the base for <u>insertion into and</u> engaging the uterine tissue leading to the opening and securing the body to the uterine tissue leading to the opening, the base overlying the opening.
- 2. (Original) Apparatus of claim 1, wherein the peripheral anchor portion comprises a plurality of spikes extending from the periphery of the base.

- 3. (Original) Apparatus of claim 2, wherein the spikes terminate in a tissue engaging structure.
- 4. (Currently Amended) Apparatus of claim 3, wherein the tissue engagement structure includes barbs a barbed head.
- 5. (Withdrawn) Apparatus of claim 1, wherein the peripheral anchor portion includes a helical blade extending radially outwardly from the base.
- 6. (Withdrawn) Apparatus of claim 5, wherein the helical blade is carried by a blade disk coupled to the base.
- 7. (Currently Amended) Apparatus of claim 1, wherein the body supports an a tool engaging member that may be grasp by a tool and which allows the apparatus to be manipulated during installation.

- 8. (Original) Apparatus of claim 7, wherein the engaging member is carried by an extension of the body.
- 9. (Original) Apparatus of claim 1, wherein the seal is formed of a biocompatible material that stimulates ingrowth of fibroblastic tissue.
- 10. (Original) Apparatus as claimed in claim 1, wherein the body is fabricated of a biodegradable material.

- 11. (Currently Amended) Apparatus for preventing fluid transfer through an opening connecting an oviduct to a uterine cavity, the apparatus comprising:
 - a body;
 - a seal coupled to the body for engaging uterine tissue surrounding and defining the opening, the seal formed of a biocompatible material that stimulates ingrowth of fibroblastic tissue to create a continuous hermetic seal; and
 - a peripheral anchor portion supported by the body for <u>insertion into and</u> engaging the uterine tissue and maintaining the seal in engagement to the uterine tissue surrounding and defining the opening, the seal overlying the opening.
- 12. (Original) Apparatus of claim 11, wherein the peripheral anchor portion comprises a plurality of spikes extending from the periphery of the base.

- 13. (Original) Apparatus of claim 12, wherein the spikes terminate in a tissue engaging structure.
- 14. (Currently Amended) Apparatus of claim 13, wherein the tissue engagement structure includes barbs a barbed head.
- 15. (Withdrawn) Apparatus of claim 11, wherein the peripheral anchor portion includes a plurality of helical blades extending radially outwardly from the base for entering uterine tissue upon the application of a twisting movement of the body.
- 16. (Withdrawn) Apparatus of claim 15, wherein the helical blades are carried by a blade disk coupled to the base.
- 17. (Original) Apparatus of claim 11, wherein the body supports an a tool engaging member that may be grasp by a tool and which allows the apparatus to be manipulated during installation.

- 18. (Original) Apparatus of claim 17, wherein the engaging member is carried by an extension of the body.
- 19. (Original) Apparatus as claimed in claim 11, wherein the body is fabricated of a biodegradable material.

20. (Original) A method of preventing fluid transfer through an opening connecting an oviduct to a uterine cavity, the method comprising the steps of:

providing apparatus comprising a body having a base with a periphery, a seal formed of a biocompatible material that stimulates in-growth of fibroblastic tissue carried by the body and a peripheral anchor portion extending from the base;

positioning the apparatus with the seal overlying and engaging uterine tissue leading to the opening;

inserting the peripheral anchor portion into the uterine tissue surrounding and defining the opening; and

receiving fibroblast in-growth in the seal to create a hermetic seal between the oviduct and the uterine cavity.
